System Features

The Denver Museum of Nature and Science is the fourth largest U.S. museum with more than 200,000 square feet of space for exhibits, a planetarium and IMAX theater. The museum needed technology that would emphasize the experience for visitors and serve as a visual centerpiece for the exhibits.

- The museum has a 4K resolution MicroTile video wall consisting of 117 tiles that display nature and science related video, and is supported by a video processor and switcher that allows unrestricted blending, mixing and scaling to produce dynamic content
- Another video wall behind the ticket counter displays museum pricing, IMAX show times, highlights current exhibits, and allows museum officials to easily change any of the displayed information
